The limits of the skin paddle are: The 7 th rib inferiorly. Laterally the extent of the pectoralis major muscle. Medially the border is at the midline of the sternum. The skin paddle position over the muscle will depend on the location of the neck/oral defect. The skin paddle illustrated in this ...

Pectoralis myocutaneous pedicle flap - AO Foundation

The pectoralis major myocutaneous (PMMC) flap has always been considered the workhorse flap for oral, head, and neck reconstruction. In 1979, Ariyan was the first to describe the use of the PMMC flap in head and neck reconstruction.

Pectoralis Major Myocutaneous Flap | Pocket Dentistry

The pectoralis major myocutaneous flap and myofascial flap variation are utilized in a large variety of head and neck reconstructive procedures that can include coverage of mucosal and/or cutaneous defects.

Pectoralis Major Myocutaneous Flap and Myofascial Flap

Both the major arteries were enclosed within the muscle's fascial envelope. A technique for developing a standard pectoralis major myocutaneous island flap is described. Our studies show that a hemichest flap incorporating all the skin of the chest over the muscle is feasible.

The vascular anatomy of the pectoralis major myocutaneous flap

Introduction The pectoralis major myocutaneous flap for reconstruction was first described in 1968. Its application in the head and neck region, however, was not reported until Ariyan's publication in 1979. The reliability and versatility of this flap were subsequently confirmed by many other reports.

Pectoralis Major Flap | Plastic Surgery Key

Although the pectoralis major myocutaneous flap is often used in head and neck reconstruction, the extension of the skin paddle beyond the inferior limits of the muscle has not been well described. We aim to clarify the design and application of this extended flap in head and neck reconstruction.

Extended pectoralis major myocutaneous flap in head and

AHNS Educational Videos: Free and Regional Flaps for Head and Neck Reconstruction

Pectoralis Major Myocutaneous Flap - YouTube

The pectoralis major is a fan-shaped muscle of the anterior chest which functions to adduct and medially rotate the arm (FIG 1). FIG 1 • Anatomy of the pectoralis major myocutaneous flap. The pectoralis muscle inserts into the medial one-third of the clavicle as well as the sternum and cartilaginous portions of ribs 1 to 6.

Pectoralis Major Flap for Pharyngeal Reconstruction

A Pectoralis Major Pedicled flap maintains its own blood supply and is one of the most common ways of replacing tissue in the head and neck, particularly after neck, throat and mouth cancers have been removed. It can be used to replace large parts

Pectoralis Major flap | British Association of Oral and

The pectoralis myocutaneous flap is based on the thoracoacromial artery (pectoral branch), which exits the subclavian artery at the midportion of the clavicle and courses medial to the insertion of the pectoralis minor tendon. The flap can be designed with a skin paddle centered over the lower portion of the muscle, which can be placed intraorally if necessary.

Myocutaneous Flap - an overview | ScienceDirect Topics

Three hundred seventy-one patients underwent pectoralis major myocutaneous flaps; of these, 335 (90.3%) were men, with a median age of 56 years (range, 24-91 years). Tumors were located at the oral cavity and oropharynx in 246 patients (66.3%). Most tumors were at an advanced stage at presentation (T3-T4 in 60.9%).

Pectoralis major and other myofascial/myocutaneous flaps

The pectoralis major flap is an axial flap and is based primarily on the pectoral branch of the thoracoacromial artery and The thoracoacro-mial artery is a branch of the axillary arte-ry, itself a continuation of the subclavian artery. The pectoral branch of the thoraco- Deltoid Pectoralis major: clavicular head Pectoralis major: sternocostal head Serratus anterior

OPEN ACCESS ATLAS OF OTOLARYNGOLOGY, HEAD & NECK OPERATIVE

The Pectoralis Major Myocutaneous Flap Large maxillofacial defects secondary to trauma or cancer ablation frequently pose a challenge for the reconstructive surgeon. These defects often cannot be closed without excessive tension and obliteration of normal anatomy.

The Pectoralis Major Myocutaneous Flap | Pocket Dentistry

The pectoralis major myocutaneous (PMMC) flap has been used as a versatile and reliable flap since its first description by Ariyan in 1979. In India head and neck cancer patients usually present in the advanced stage making PMMC flap a viable option for reconstruction.

Pectoralis major myocutaneous flap in head and neck

Pectoralis myocutaneous muscle flap anatomy The pectoralis major is a large superficial muscle that fans out from the median half of the clavicle extending to the second to seventh costal cartilages and the aponeurosis of the external oblique muscle. The muscle fibers then laterally converge to insert into the greater tubercle of the humerus.

The pectoralis major myocutaneous flap - ScienceDirect

Pectoralis major myocutaneous pedicle flap is harvested in the standard fashion with the following considerations: An adequate length of the flap must be ensured to allow a skin paddle of adequate size to reach to the oral cavity defect without tension.

Pectoralis major myocutaneous pedicle flap for Lateral

The pectoralis major myocutaneous flap (PMMF) is useful in head and neck reconstruction. The extent of coverage and the reach of the flap are dependent on the anatomy of the patient but the upper limits are generally considered the zygomatic arch externally and the tonsillar bed internally.

Tor Chiu - Otorhinolaryngology

The pectoralis major myocutaneous pedicle flap (PMMF) is still being used by many surgeons and plays an important role in head and neck reconstruction. The purpose of this series was to review our 10 years' experience with the PMMF in head and neck reconstruction.
