Science and technology are obvious enough. Bertrand Russell saw in the 1950s that there are also many negative aspects of scientific innovation. Insightful and controversial in equal measure, Russell argues that science offers the world greater well-being than it has ever known, on the condition that prosperity is dispersed; power is diffused by means of a single, world government; birth rates do not become too high; and war is abolished. Russell acknowledges that is a tall order, but remains essentially optimistic. He imagines mankind in a 'race between human skill as to means and human folly as to ends', but believes human society will ultimately choose the path of reason. Sluckin and Russell

Bertrand Arthur William Russell, 18 May 1872–2 February 1970) was a British philosopher, logician, mathematician, historian, writer, social critic and political activist. At various points in his life he considered himself a liberal, a socialist, and a pacifist. In the early 20th century, Russell led the British "revolt against idealism". He is considered one of the founders of analytic philosophy along with his predecessor Gottlob Frege, colleague G. E. Moore, and his protégé Ludwig Wittgenstein. He is widely held to be one of the 20th century's premier logicians. With A. N. Whitehead he wrote *Principia Mathematica*, an attempt to create a logical basis for mathematics. His work has had a

Why would a NASA rocket scientist move to Bhutan to plant hazelnuts? How could something as complex as the Ozone hole chemistry lead to the Montreal Protocol, in the words of the UN Secretary General, "The single most successful international agreement?" How can we know so much about climate change and yet fail to move forward? How could basic physics of melting wax save the lives of thousands of babies worldwide?

We have more scientists than ever before, more data than we ever dreamed, and technology in every aspect of life. And yet, with all of the wealth of facts, it seems there is still a stark polarization of opinions and paralysis of action. What is missing? This book explores, via stories of both success and failure, the weakening link between the research-driven scientists focused on understanding and creating knowledge, and the role of scientists integrating an impact-driven attitude. Scientists are good with data, but it is not just about data; it is what we do with it. Facts do not change the world-people do. This book is updated based on feedback. Current version is 7 (Summer 2019).
